

Tradescharge

Real-time net F&O P&L after every Zerodha cost

Investor pitch deck · May 2026 · Confidential

The problem

- Kite shows **gross P&L** on open and closed legs — not what you actually keep after brokerage, STT, exchange fees, GST, and stamp duty.
- On busy scalp days, **turnover qty** $\neq$ **net flat qty**; traders misread breakeven and exit too early or too late.
- Transaction costs are invisible until the **contract note** — too late for intraday decisions on SL, target, and capital protection.
- Third-party tools often show analytics or greeks; few show **live, charge-aware net P&L** aligned to Zerodha's fee structure.

The solution

Tradescharge is a **view-only** dashboard that connects to Zerodha via Kite Connect OAuth. Traders continue to place orders on Kite; Tradescharge shows the true economics of each leg in real time.

- **Live net P&L** per open and closed position with entry + exit charge breakdown.
- **Portfolio-aware breakeven** — points and lots required to cover all legs and costs.
- **Capital balance** reflecting margin-enabled cash and today's charge-aware net result.
- **Reconciliation-grade charge engine** built from Zerodha's published F&O fee schedule.

Market opportunity

Segment	Estimate	Notes
TAM — India retail F&O participants	~8–10M accounts	Rapid growth post 2020; options dominate volume
SAM — Zerodha active F&O traders	~2.5M users	Primary MVP segment (Zerodha ecosystem)
SOM — Year 3 target	15,000–25,000 paying	0.6–1% of SAM; community-led acquisition

India F&O turnover remains among the world's largest; retail participation and options complexity increase demand for **post-cost clarity** during the session, not only EOD statements.

Competitive landscape

Player	What they offer	Gap vs Tradescharge
Zerodha Kite	Gross P&L, margins, orders	No live per-leg net after all charges
Sensibull / Opstra	Strategy, OI, greeks	Not contract-note-grade live net P&L
Broker contract note	Final accurate costs	EOD only; no intraday support
Excel / manual	Custom trackers	Stale, error-prone, no live ticks

Competitive advantage

- **Accuracy moat:** Charge engine validated against Zerodha contract notes and tradebook (May 2025: portfolio gross ■-6,682 and net ■-13,532 matched within ■0.44).
- **Live-first design:** Built for intraday ticks and multi-leg portfolios, not EOD spreadsheets.
- **Trust positioning:** View-only — no order routing; reduces regulatory and user-trust friction vs execution apps.
- **Zerodha-native:** Fee logic mirrors Kite's F&O schedule (brokerage caps, STT on sell, stamp on buy, IGST).
- **Depth for scalpers:** Handles multiple round-trips per symbol; uses Kite authoritative gross with transparent charge split.

Product — features & benefits

Feature	Benefit to trader
Real-time gross & net P&L per leg	Know true win/loss before contract note
Entry / exit charge breakdown	See STT, brokerage, GST, stamp, exchange, SEBI
Charge-aware breakeven calculator	Set SL/target with costs included
Live index tickers + option chain	Context without leaving P&L view
Closed book + executed tab	Audit day against broker records
Demo mode	Try without login; convert via Kite OAuth

Traction & validation

Product maturity

- MVP live: React dashboard + Express API + Kite Connect OAuth (view-only default).
- Automated test suite for charges, order validation, closed-position builder, and live sync.
- Short-option writer support and margin-aware capital display shipped.

Validation completed

- May 25, 2026: 5 closed F&O legs reconciled to contract note — gross, net, and charge heads ($\Delta < \blacksquare 1$).
- Cross-checked against Kite P&L export and tradebook CSV (172 trades).
- PRD reference contract note ($\blacksquare 17.46L$ turnover $\rightarrow \blacksquare 2,415.61$ charges) — engine test passing.

Users & growth trajectory

- **Stage:** Pre-revenue closed beta — founder dogfooding + invite-only testers.
- **User feedback:** Informal; formal cohort study planned post-Render deploy.
- **Trajectory:** Q2 2026 — 10–20 beta users $\rightarrow$ Q3 — public waitlist $\rightarrow$ Q4 — paid tier pilot (500 users target).

Note: Traction figures are targets for planning; update before investor meetings with actuals.

Business model

Revenue

- **Freemium SaaS (B2C):** Free tier — 1 index, delayed refresh, 3 legs visible; Pro ■399–■799/mo — live stream, full book, breakeven tools, export.
- **Annual plan:** ■3,999/yr (~2 months free) for active traders.
- **Future:** Referral with discount brokers (no payment for order flow — view-only today).

Customer acquisition

- Content: Reddit (r/IndianStreetBets, r/IndiaInvestments), X, YouTube — “gross vs net P&L” education.
- Community: Closed beta → waitlist → founder-led demos.
- SEO: “Zerodha net P&L calculator”, “F&O charges live”, contract-note reconciliation.
- Partnerships: Trading educators, Telegram groups (compliance-safe disclaimers).

Financial forecast (illustrative)

Assumptions: 5% free-to-paid conversion among active beta users; ARPU █550/mo blended; infra █15–25K/mo at scale; solo founder + contractors Year 1.

Metric	Year 1	Year 2	Year 3
Paying subscribers (EoY)	400	2,500	12,000
MRR (█)	2.2L	13.8L	66L
ARR (█)	26L	1.65 Cr	7.9 Cr
Gross margin	~85%	~88%	~90%
Net burn / profit	(█8–12L)	Break-even	Profitable

Forecasts are illustrative for discussion. Not audited. Requires validation through paid beta and CAC/LTV measurement.

The ask & next steps

- **Raise / use of funds:** ■25–40L pre-seed or angel — 40% infra & Kite compliance, 35% growth, 25% product (multi-broker roadmap).
- **12-month milestones:** Render production deploy → 500 paying users → multi-day reconciliation report → Bank Nifty/BFO parity.
- **Why now:** Retail F&O participation at peak; traders feel cost pain daily; no dominant “net P&L layer” on Kite.
